

This scenario may have one single risk. The system may not comply with ASR requirements.

Second scenario has risk too because of security issue. System doesn't require an e-mail additional to user-name and password.

Allowing login to App with just using the username can result in anyone logging into another user's home page without using a password. There is a risk.

On this scenario; it has non-risk. Because an error message displays when an item is created without a name.
